Context of the Dashboard

The dashboard is an executive and sales strategic dashboard showing Key Performance Indicators (KPI's) and exploring the financial performance of a global superstore business in the retail domain. The metrics focused on are Sales and Profit broadly analysed over time, product category and countries/regions of the entire business.

The dashboard encompasses historical data to track trends however can also give snapshot views of current data if more real time analysis is needed.

The target users of the dashboard are members of the executive team, sales managers and regional directors. It will be used to help make strategic business decisions and reach target figures for the financial year. These users will be concerned with overall business health and growth, a view of regions that are performing well or underperforming to identify areas of focus, similar performance measures based on products and how these factors change over time (Klipfolio, N.D.).

Benefits of the dashboard on the users

By showing the metrics of sales and profit with regards to time, product category and regions the users can monitor KPI's actively if the data is frequently updated and reviewed throughout the year. The dashboard gives a high-level overview of the data with the ability to drill down if needed, meaning the user is in control of the level of detail they want to see.

It helps centralise the key information for the executives, saving time and leading to quicker decision-making. Due to the structured layout, the dashboard aids in picking out the important information easily, also improving communication of findings and productivity (França, 2024).

The choropleth visual will help regional directors identify business performance in each county, helping to direct resource and make strategic changes in the underperforming regions. The visualisations of sales and profit all together can help executives identify trends, spot issues or unpopular products, as well as capitalise on opportunities in regions or with popular product categories.

Future: the vision for this dashboard

This dashboard is using pre-existing Superstore Data gathered from Kaggle and covers the years of 2011-2014 (Mahalingappa, 2020). A future improvement other than using static data could be to have the dashboard integrated with a business CRM for real-time dynamic updates, while not necessary for the executive summaries it would be useful for operational sales purposes and regional directors.

Further drill down capabilities could be implemented for deeper data insights, for example drilling into city views for the choropleth, and having a page reset button to get back to the top-level view. For an executive dashboard, other metrics may be valuable such as business expenses in the regions, customer satisfaction and shipment details. This could be implemented in a multipage dashboard so that the information is kept clear and easily readable.

This dashboard could be tailored further to an individual business stylistically by adopting the business colours, logo and other business specific elements.
